Features used to implement the example

- [Boolean validator with math, date-time or text-string terms](#)

Example: If field A is populated, then field B must also be populated

I will explain how to implement a validation **"If field A is populated field B must also be populated"** using [Boolean validator with math, date-time or text-string terms](#) using the following configuration:

Boolean expression to be evaluated:

```
%{11200} = null OR ( %{11200} != null AND %{11600} != null )
```

Logical connectives: or, and and not. Alternatively you can also use |, & and !.

Comparison operators: =, !=, >, >=, < and <=.

Logical literals: true and false. Literal null is used with "=" and "!=" to check whether a field is initialized, e.g. `{00012} != null` checks whether **Due Date** is initialized.

Note that:

- `%{11200}` is the field code for field **A**
- `%{11600}` is the field code for field **B**

Field codes depend on each Jira instance. There are select lists in validator configuration screen to insert field codes in your boolean expression.

Once configured, the validator will look like this:

Conditions 0

Validators 1

Post Functions 8

The transition requires the following criteria to be valid [Add validator](#)

Only if the following boolean expression is true: `%{A} = null OR (%{A} != null AND %{B} != null)`

Message to show when validation fails:
