

Sum of field values from issues in JQL query

Use case

Return the **sum the values of a specific field from the issues returned by a JQL query**.

Expression

Create and configure a **Smart field** using this expression in **General** parsing mode:

```
%{sum(fieldValue({issue.cfnnnnn},issuesFromJQL("project = DEMO and 'fieldName' is not empty")))}
```

Please, replace *nnnnn* in the above expression with the ID of the Number custom field and *fieldName* with its name. Additionally, replace the *DEMO* project key with the corresponding project key of your project

This expression can be customized to limit the issues from which the values are obtained by modifying the JQL query in the *issuesFromJQL()* parser function.

Used parser functions

- [sum\(\)](#)
- [fieldValue\(\)](#)
- [issuesFromJQL\(\)](#)
