JWT Release Notes 2.2.36

[2017-04-21] **Released Jira Workflow Toolbox 2.2.36**

New features

- New Functions added to the parser:

FUNCTION	RETURNED VALUE
componentLeader(string **component_name**) : string	Returns the **user name** of the leader of the component with name **component_name** in current issue's project. This function also admits a comma separated list of components, and returns a comma separated list of **user names**. Output will contain repeated user names if a same user is leader of more than one component. Example: **`componentLeader(%{00094})`** returns a comma separated list with the user names of the leaders of current issue's components.
componentLeader(string **component_name**, string **project_key**) : string	Returns the **user name** of the leader of the component with name **component_name** in project with key **project_key**. This function also admits a comma separated list of components, and returns a comma separated list of **user names**. Output will contain repeated user names if a same user is leader of more than one component. Example: **`componentLeader("Web Portal", "CRM"))`** returns the user name of the leader of the component with name **Web Portal** in project with key **CRM**.

Improvements

- Issue #254 - The following post-function now allow setting more than field at the same time:
  - **Write field on linked issues or sub-tasks**
  - **Read fields from linked issues or sub-tasks**
  - **Update issue fields**
  - **Read field from issues returned by JQL query or issue list**
- Issue #557 - Function **`issueKeysToIssueList()`** also admits **issue IDs** in addition to **issue keys**.

Bug fixes

- Function **`availableItems()`** and **`allAvailableItems()`** applied on field **Components leaders** returned the list of all the users in the Jira instance, instead of the list of leaders of the components in the project.
- Problem on **Create issues and sub-tasks** post-function when setting fields whose names contain a **comma** character.
- Issue #573 - Problems with some parser functions when received a **`null`** value as input.
- Issue #583 - Problem when deleting an issue type from Jira and it was being used in a condition, validation or post-function.
- Issue #537 - Problem with function **`hasChanged()`** when field checked is used by another feature of the plugin in the same transition.
