JWT Release Notes 2.2.34

[2017-03-15] **Released Jira Workflow Toolbox 2.2.34**

New features

- Added new functions to the parser:

Function	Returned value
formatWorkDuration(number **duration**) : string	Similar to function `formatDuration()` but using the **workday** and **workweek** defined at **time tracking configuration**, instead of 24 hours per day and 7 days per week. Example: `formatWorkDuration(5 * 8 * {HOUR} + 2 * 8 * {HOUR} + 3 * {HOUR})` returns **"1 week, 2 days, 3 hours"**, with 8 hours per **workday** and 5 days per **workweek**.
shortFormatWorkDuration(number **duration**) : string	Similar to function `shortFormatDuration()` but using the **workday** and **workweek** defined at **time tracking configuration**, instead of 24 hours per day and 7 days per week. Example: `formatWorkDuration(5 * 8 * {HOUR} + 2 * 8 * {HOUR} + 3 * {HOUR})` returns **"1w 2d 3h"**, with 8 hours per **workday** and 5 days per **workweek**.

Improvements

- More examples in the parser's documentation.

- Added parameter "**Use time tracking settings**" to **Calculated Number Field**. This parameter allows to calculate a **time duration** using the **workday** and **workweek** defined at **time tracking configuration**, instead of 24 hours per day and 7 days per week.

Bug fixes

- **Issue #537** - Problems with functions related to field edition in transition screen

- **Issue #534** - This issue was not fully fixed in version **2.2.33**

- NullPointer exception caused by **Calculated Number Field** when used out of a valid context.
