

JWT Release Notes 2.1.28

[2015-02-25] Released [Jira Workflow Toolbox 2.1.28](#)

HOTFIX:

Version **2.1.27** introduced a bug affecting **creation of new configurations** or **edition of existing configurations** for "**Read fields from linked issues or subtasks**" and "**Write field on linked issues or subtasks**" post-functions. The problem didn't affect to normal behaviour of currently configured post-functions.

Bug description: parameter "**Target field**" couldn't be set, always taking the value of "**Source field**", i.e., both parameters showed the same value. Post-functions configured by versions of the plugin previous to 2.1.27 kept the correct value for parameter "**Target field**", and worked flawlessly. The problem only appeared when trying to edit the configuration of the post-function.

Version **2.1.28** fixes this bug, not adding new features or modification respect to version 2.1.27.
