

# JWT Release Notes 2.2.1

[2015-10-28] Released [Jira Workflow Toolbox 2.2.1](#)

## New Features

- Added a new virtual field called "**New labels**": it can be used for adding new labels to current issue, parent issue (using "**Parent's new labels**"), or to any other issue using "[Write field on linked issues or sub-tasks](#)" and "[Write Field On Issues Returned By JQL Query](#)" post-functions.
- Added new parser functions:

FUNCTION	RETURNED VALUE
<b>siblingSubtasks()</b> : <i>issue list</i>	Returns the list of sibling subtasks of current issue, i.e., all subtasks with the same parent as current issue, except current issue. In case current issue is not a subtask, an empty issue list will be returned. Note that <i>siblingSubtasks()</i> is equivalent to <i>subtasks(%{00041}) EXCEPT issueKeysToIssueList(%{00015})</i> , where <i>%{00041}</i> is <i>Parent's issue key</i> and <i>%{00015}</i> is <i>Issue key</i> .
<b>siblingSubtasks(issue list issues)</b> : <i>issue list</i>	Returns the list of sibling subtasks of issues in argument <b>issues</b> , provided they are subtasks. Duplicated issues in argument <b>issues</b> are discarded.
<b>siblingSubtasks(string issue_keys)</b> : <i>issue list</i>	Returns the list of sibling subtasks of issues whose keys are in <b>issue_keys</b> , provided they are subtasks. Argument <b>issue_keys</b> is a comma separated list of issue keys. Duplicated issue keys in argument <b>issue_keys</b> are discarded.

## Improvements

- A text box has been included in "[Add a comment](#)" post-function, this way the body of the comment can be directly input in the post-function, instead of using a previous post-function for writing it into an *ephemeral string* field.
- Issue #176**: Added cursor position information in expression's editor, in order to find parsing errors more easily.
- Added two new configuration parameters to "[Parse field for extracting data](#)" post-function:
  - Include the leading delimiter in the output
  - Include the trailing delimiter in the output

## Bug Fixes

- Issue #178**: Parent issue not being reindexed after being updated after having written a "*Parent's...*" virtual field.
- "[Set a field as a function of other fields](#)" didn't manage correctly some errors when extremely bad formed setting rules were entered.
- Issue #176**: Expression's editor was inserting a third double quote (") character after having entered string "".
- "[Block or hide a transition for an issue depending on its issue links](#)" and **parser's functions related to issue links** (*linkedIssues()*, *transitionLinkIssues()* and *transitivelyLinkedIssues()*) were not detecting "**Epic-Story**" special issue link created or updated in transition screen or during issue creation.
- Javascript bug on "[Add a comment](#)" post-function in relation to selection of visibility restriction.
