

JWT Release Notes 2.1.30

[2015-03-29] Released [Jira Workflow Toolbox 2.1.30](#)

New features

- New post-function "**Inhibit ephemeral fields auto-clearance**": By default, ephemeral fields are automatically deleted at the end of the transition. This post-function makes ephemeral field auto-clearance be skipped for current transition, this way leaving current ephemeral field's values at disposal of the next transition.

Bug fixes

- [Issue #110](#): Integrity problems caused by triggering a series of delayed transition executions
- [Issue #102](#): prefixes '+' and '-' didn't work when used on **parent issue's fields**.
- Improved management of **JQL queries**: expressions like **IN (%{nnnnn})** showed an error when field %{nnnnn} was not initialized. Now this situation is correctly managed and no error is produced.
- [Issue #108](#) - **Delayed transition execution** didn't work on **parent issue** when used in "Create Issue" transition
- New **expression editor** introduced in version 2.1.29 contains a minor javascript error with **Google Chrome**.
- [Copy parsed text to a field](#)'s automatic parsing mode converter didn't manage correctly field codes longer than 5 digits.
- Ephemeral fields were auto-cleared before end of transition under certain circumstances.
