- [Example: Create a comment in sub-tasks when parent transitions](#)
- [Other examples of that functions](#)
- [Related Usage Examples](#)

Features used to implement the example

- [Copy a parsed text to a field](#)
- [Write field on linked issues or sub-tasks](#)

Example: Create a comment in sub-tasks when parent transitions

I'd like to add a post-function so that when a parent issue is resolved all sub-tasks get a new comment in the form of: **"The parent issue of this subtask has been resolved as "<resolution goes here>" <Parent Issue Key>"**

You can do it using 2 post-functions in transition **"Resolve Issue"** of parent's workflow.

Post-function [Copy a parsed text to a field](#) with the following configuration:

Target field:	
Ephemeral string 1 - [Text]	
Field to be written with the resulting parsed text.	
<input type="checkbox"/> Don't overwrite target field if it's already set.	
Parsing Mode:	
<input checked="" type="radio"/> Basic	Basic mode: Insert field codes anywhere in the text, and they will be replaced with corresponding field values. Field code formats are <code>%(nnnnn)</code> , and <code>%(nnnnn.i)</code> for Cascading Select fields (i = 0 for base level).
<input type="radio"/> Advanced	Advanced mode: Strings literals are written in double quotes ("This is a string."). Operator '*' is used to concatenate strings, and field codes are like in basic mode, e.g., "Issue key is " + <code>%(00015)</code> + ". More information at parser syntax documentation .
Text to be parsed and then copied to target field:	
[Line 1 / Col 1]	
Syntax Specification	
1	The parent issue of this subtask has been resolved as " <code>%(00028)</code> ": <code>%(00015)</code> .

Text to be parsed is:

The parent issue of this subtask has been resolved as "`%(00028)`": `%(00015)`.

Note that:

- `%(00028)` is field code for **"Resolution"**
- `%(00015)` is field code for **"Issue Key"**

Post-function [Write field on linked issues or sub-tasks](#) with the following configuration:

Source field to be read in current issue:	Ephemeral string 1 - [Text]
Target field to be written in linked issues or subtasks:	New comment - [Text] <input type="checkbox"/> Don't overwrite target field if it's already set.
Filtering by issue link type:	<div><input type="checkbox"/> is blocked by</div> <div><input type="checkbox"/> blocks</div> <div><input type="checkbox"/> is cloned by</div> <div><input type="checkbox"/> clones</div> <div><input type="checkbox"/> is duplicated by</div> <div><input type="checkbox"/> duplicates</div> <div><input type="checkbox"/> relates to</div> <div><input type="checkbox"/> relates to</div> <div>Only issues linked to current issue by selected issue link types will be written.</div>
Write also subtasks fulfilling condition on issue type, status and project:	<input checked="" type="checkbox"/> This option only makes sense when current issue itself is not a subtask.
Write also sibling subtasks fulfilling condition on issue type, status and project:	<input type="checkbox"/> Sibling subtasks are understood as subtasks with the same parent as current issue. This option only makes sense when current issue is itself a subtask.
Filtering linked issues or subtasks by issue type:	<div><input type="checkbox"/>  Bug</div> <div><input type="checkbox"/>  Improvement</div> <div><input type="checkbox"/>  New Feature</div> <div><input type="checkbox"/>  Task</div> <div><input type="checkbox"/>  Sub-task</div> <div>Selected issue types will be written, but if you don't select any, it won't be applied any filter by issue type. In that case all the issue types will be written.</div>
Filtering linked issues or subtasks by status:	<div><input type="checkbox"/>  Open</div> <div><input type="checkbox"/>  In Progress</div> <div><input type="checkbox"/>  Reopened</div> <div><input type="checkbox"/>  Resolved</div> <div><input type="checkbox"/>  Closed</div> <div>Selected statuses will be written, but if you don't select any, it won't be applied any filter by status. In that case issues in any status will be written.</div>
Linked issues or subtasks belong to:	<div><input checked="" type="radio"/> any project</div> <div><input type="radio"/> current project</div> <div><input type="radio"/> any but current project</div>

1

Filtering by field values:

Optional boolean expression that should be satisfied by issues in order to be selected. [\(Syntax Specification\)](#)

Leave field empty for no filtering.

[Line 1 / Col 1]

Logical connectives: or, and and not. Alternatively you can also use |, & and !.

Comparison operators: =, !=, >, < and <=. Operators ~, !~, in, not in, any in and none in can be used with strings, multi-valued fields and lists.

Logical literals: true and false. Literal null is used with "= " and "!=" to check whether a field is initialized, e.g. {00012} != null checks whether Due Date is initialized.

Numeric/Date Field Code Injector:

Original estimate (minutes) - [Number] - {00068}

Field Code for Current Issue

Field Code for Foreign Issues

String Field Code Injector:

Summary - [Text] - %{00000}

Field Code for Current Issue

Field Code for Foreign Issues

Term "Foreign Issues" refers to issues susceptible to being filtered, i.e., linked issues, subtasks, or any issue different from current one.

Example 1: boolean condition {00012} <= ^{00012} will require that issues have Due Date equal or later than current issue's Due Date.

Example 2: boolean condition %{00074} ~ ^{00074} AND ^{00017} in ["Blocker", "Critical"] will require that issues have Fixed versions contained in current issue's Fixed versions and Priority is Blocker or Critical.

Write linked issues and subtasks recursively:

Issues and subtasks transitively linked will also be written, provided they fulfill stated filtering conditions. Issues are written recursively without depth limit, but each selected issue is written only once.

Run as:

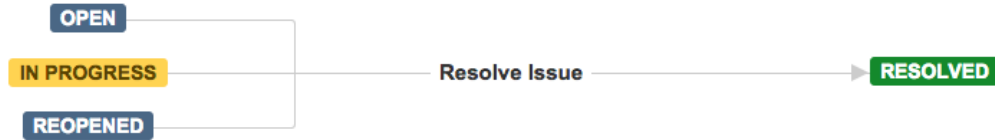

Select the user that will be used to execute this feature. JIRA will apply restrictions according to the permissions, project roles and groups of the selected user.

Current user

User defined by a field.

Input a certain fixed user. Expected value is a user name, don't confuse it with user's full name.

Once configured, transition "Resolve Issue" in parent's workflow will look like this:

Screen: Resolve Issue Screen

Conditions 1

Validators 0

Post Functions 7

The following will be processed after the transition occurs

[Add post function](#)

1. The following text parsed in **basic** mode will be copied to **Ephemeral string 1**:
The parent issue of this subtask has been resolved as "{Resolution}": {Issue key}.
 This feature will be run as user in field **Current user**.
2. Value of field **Ephemeral string 1** in current issue will be copied to field **New comment** in linked issues or subtasks filtering by:
 Inward issue link types: **none**
 Outward issue link types: **none**
Subtasks fulfilling conditions on issue type, status and project **will be written**.
Sibling subtasks won't be written.
 Issue types: **any**
 Statuses: **any**
 Linked issues or subtasks may belong to **any** project.
 This feature will be run as user in field **Current user**.
