

# JWT Release Notes 2.2.34

[2017-03-15] Released [Jira Workflow Toolbox 2.2.34](#)

## New features

- Added new functions to the parser:

Function	Returned value
<b>formatWorkDuration</b> (number duration) : string	Similar to function <b>formatDuration</b> ( ) but using the <b>workday</b> and <b>workweek</b> defined at <a href="#">time tracking configuration</a> , instead of 24 hours per day and 7 days per week. Example: <b>formatWorkDuration</b> (5 * 8 * {HOUR} + 2 * 8 * {HOUR} + 3 * {HOUR}) returns "1 week, 2 days, 3 hours", with 8 hours per <b>workday</b> and 5 days per <b>workweek</b> .
<b>shortFormatWorkDuration</b> (number duration) : string	Similar to function <b>shortFormatDuration</b> ( ) but using the <b>workday</b> and <b>workweek</b> defined at <a href="#">time tracking configuration</a> , instead of 24 hours per day and 7 days per week. Example: <b>formatWorkDuration</b> (5 * 8 * {HOUR} + 2 * 8 * {HOUR} + 3 * {HOUR}) returns "1w 2d 3h", with 8 hours per <b>workday</b> and 5 days per <b>workweek</b> .

## Improvements

- More examples in the parser's documentation.
- Added parameter "Use time tracking settings" to [Calculated Number Field](#). This parameter allows to calculate a **time duration** using the **work day** and **workweek** defined at [time tracking configuration](#), instead of 24 hours per day and 7 days per week.

## Bug fixes

- [Issue #537](#) - Problems with functions related to field edition in transition screen
- [Issue #534](#) - This issue was not fully fixed in version [2.2.33](#)
- NullPointerException caused by [Calculated Number Field](#) when used out of a valid context.
