

# JWT Release Notes 2.2.18

[2016-08-30] Released [Jira Workflow Toolbox 2.2.18](#)

## Improvements

- Support for reading and setting [Insight - Asset Management for Jira](#) custom fields
- Added a new optional **parameter for inhibiting validators** when an issue is being created by cloning. This parameter is specially useful when validating issue links in "Create Issue" transition, since when an issue is being cloned firstly the clone issue is created, and then issue links are cloned. Any validation on issue links will fail at issue cloning if we don't inhibit them.

## Bug Fixes

- [Issue #324](#) - Transition executions triggered by post-function stop working under certain circumstances: definitively fixed.
- Parser function `isAClone()` didn't work with Jira 7.1 or higher.
- Validations on issue links on "Create Issue" transition didn't work on Jira 6.2.x.
