JWT Release Notes 2.2.46

[2017-12-21] Released **Jira Workflow Toolbox** 2.2.46

Improvements

- **Mixed parsing mode**: this mode is similar to **basic** parsing mode but allows inserting **string** and **math-time** expressions between 3 curly brackets, i.e., `{{{ expression }}}`. Examples:
    - Example 1:
    `Number of subtasks: {{{count(subtasks())}}}`
    - Example 2:
    `Tomorrow is: {{{dateToString({00057} + 1 * {DAY}, LOCAL, SERVER_LANG)}}}`
    - Example 3:
    `Description from WIKI to HTML: {{{wikiToHTML(%{00001})}}}`
    - Example 4:
    `Formatted summary: {{{capitalizeWordsFully(trim(%{00000}))}}}`

This new parsing mode is currently only supported for setting email's **subject** and **body** in post-function **Send an email**.

Bug fixes

- When setting a leading and trailing delimiter in post-function **Parse field for extracting data** and there was more than one occurrence of the trailing delimiter, the text value extracted was all the content between the leading delimiter and the farthest trailing delimiter. This version fixes this problem, and the value extracted is the text between the leading delimiter and the closest trailing delimiter.

- Very rare problem with long field codes for parent issue.

- **Issue #909** - Parameter "**Run As**" is not working correctly in post-function **Create issues and subtasks**.

- **Issue #888** - Writing into certain virtual fields (e.g., **Epic Link**) didn't consider the user selected in parameter "**Run As**".
