Features used to implement the example

- [Validation based on regular expression](#)

Example: Make "Affects Version/s" mandatory when issue resolution is "Fixed"

You can implement using [Validation based on regular expression](#). You have to use a validator in transition "Close" and "Resolve" using the following configuration:

Field or parsed text to be checked for matching with the regular expression:	<input type="radio"/> Field <input checked="" type="radio"/> Parsed text	<div>Summary</div> <div>%{00028}@%{00077}</div>
Regular expression:	<div>^Fixed@\$</div> <div>You can insert field codes into the regular expression that will be replaced with the corresponding field value. Regular expression syntax</div>	
Negate validation:	<input checked="" type="checkbox"/> When this option is checked, validation will be satisfied if regular expression is NOT MATCHED by selected field or entered parsed text.	
Message to show when validation fails:	<div>Affected version is mandatory for fixed issues.</div>	

Text to be parsed is:

```
%{00028}@%{00077}
```

```
^Fixed@$
```

Once configured, transition will look like this:

The transition requires the following criteria to be valid	Add validator
If parsed text " #Issue resolution#@#Affected versions# " <u>doesn't match</u> the following parsed regular expression: (^Fixed@\$). Message to show when validation fails: Affected version is mandatory for fixed issues.
