

JWT Release Notes 2.4.0

[Direct download from Marketplace](#)

New features

- **New post function: "Update issue fields"** (formerly known as **Write fields on issues returned by JQL query or issue list**)
 - New target issue selection options: Current Issue, Parent Issue, Linked Epic, and many more)
 - Simple selection of target field values: (Single Select, Multi Select, Priorities, Resolutions, Components, ...)
 - Easily purge field values with the new built-in "Clear field value" option
- **Expression Parser Test page**
 - A completely new page in the administration interface to evaluate parser expressions - test against existing issues in real time without any risk
 - Supports *basic*, *mixed*, *advanced*, *date/time/number* und *logical mode*
 - Write and test your expressions including syntax highlighting and syntax check
- **New Parser Functions:**
 - **dateTimeToString**(number t, string date_time_pattern , timeZone time_zone, language) : string
 - **htmlToTxt**(string s) : string
 - **projectKeys**() : string list
 - **projectKeys**(string category) : string list
 - **projectName**(string project_key) : string
 - **projectCategory**(string project_key) : string

Details can be found here: [Expression Parser's documentation page](#).

Improvements

- **Parametric issue type selection** in post function "**Create issues and sub-tasks**"
 - Create multiple issues **with various issue types** in a single post function
 - Dynamically inherit the issue type from the issue firing the transition
 - Create both standard and sub-task issue types
- New parameter "**timezone**" added to **Display Format** configuration of **Calculated Date-Time** fields.

Bug fixes

- Functions **addTimeSkippingWeekends()**, **addTimeSkippingWeekends()**, **addDaysSkippingWeekends()**, **addDaysSkippingWeekends()**, **subtractDatesSkippingWeekends()** and **subtractDatesSkippingWeekends()** return inaccurate results under certain circumstances. All functions were completely rewritten using "**SDG**".
- Functions **dateToString()** and **dateTimeToString()** ignore input parameter **timezone**.
- **TransitionOptions** did not work in delayed transitions
