JWT Release Notes 2.4.1

This version has been replaced with version 2.4.2, because it introduced a bug in the Send an email post function.

New Features

- Both an email's **priority** and the **BCC recipients** can now be configured in the **Send an email** post function.
- Specify the **location** of the **"Message to show when validation fails"**. The message can be shown **next to any field** or at the **top of the transition screen**.
- **Insight custom fields** are now supported up to version 5.4. New Insight custom fields will be supported in the upcoming release.
- The **"Update issue fields"** post function now supports the **Portfolio Team** field.
- You can now **update Service Desk specific fields** through JWT post functions:
    - Customer Request Type
    - Organizations
    - Customer Request Channel

Improvements

- Javascript performance has been improved for all JWT functions.

Bug fixes

- Exceptions thrown by calculated fields occasionally prevent the execution of built-in issue actions (e.g. move issue, delete issue).
- **Parent's Virtual fields** couldn't be set using **Update issue fields** post function in **standard mode**.
