

JWT Release Notes 2.4.6

Insight Custom Fields introduced in Insight version 5.4 are now supported to be written with JWT post functions

[Direct download from Marketplace](#)

Improvements

- Improved support for new "**Insight Object/s**" custom field type.

Bug fixes

- **Numeric field code injectors** don't show any the following field types: **Date**, **Date-Time** and **Priority**.
- Field code injectors in **calculated fields** are showing unwanted field codes associated to **transition executions** (eg. **Transition's comment**).
- We removed one of the examples of **custom display format** for **Numeric Calculated Fields** which was wrong.
- **Cascading select comparer** throws an error when an empty configuration of it is saved.
- **Format field value** post-function was interpreting the **replacement string** parameter as a regular expression instead of a string literal.
- Parameter replacement at **parser functions** **replaceFirst**(string, regex, replacement) and **replaceAll**(string, regex, replacement) was being interpreted as a regex instead of a string literal.
