JWT Release Notes 2.4.7

⚠️ This is the first Atlassian approved data center compatible version of Jira Workflow Toolbox

Direct download from Marketplace

Improvements

- Reading new Insight custom field objects now returns a **combination of the name and the key** of insight objects. Examples: `Main Server (SFT-243)`, `Test Environment (CRM-21)`.
- Writing the new insight custom fields has been improved: the **name**, the **key** or a **combination of name and key** of insight objects are now accepted when setting insight fields. Examples: "`Main Server`", "`SFT-243`" or "`Main Server (SFT-243)`" are the 3 valid ways of setting an Insight field with a same object.

Bug fixes

- JWT **calculated number** and **date-time fields** returned error instead of null for issues not in the fields context.
- Option Picker did not return Options with a corrupt database.
- JWT now prevents creating Issue Links between an issue and itself.
- Fixed several functions to work on the parser test page.
