Number of issues in same version

Features used to implement the example

- Calculated Number Field

Example: Number of issues in same version

Count the amount of issues in the same version as the current one.

A valid configuration for this **Calculated Number Field**:

Text to be parsed

- **count(issuesFromJQL("fixVersion = " + %{00074}))**

Note that:

- **%{00074}** is the field code for **Fix Version/s**

Once configured and added to an issue screen (e.g. an epic), the result will look like this:

Other examples of that function

Page: Number of issues in same version
Page: Number of open subtasks
Page: Setting the priority depending on the multiplication of custom fields
Page: Total of all story points in an epic
Page: Total remaining estimate in an epic
