VALID UP TO VERSION 2.7.0

This validator was replaced by the [Fields required or changed validator](#) in version 2.7.0. The new validator offers **more flexibility**, allows for **multiple values** to be checked at once and even displays a **red asterisk *** if required fields have not been set.

Purpose

It's a validator for doing any of the following checks:

- A field is **initialized**.
- A field is **not initialized**.
- A field **has been edited** in transition screen.
- A field **hasn't been edited** in transition screen.

For **cascading select** fields **both levels** are required to be initialized.

Example: Check that field "My Date" hasn't been edited in transition screen

Field to be checked:	<div>My Date - [Date Picker]</div> <div>For cascading select custom fields both levels are required to be initialized.</div>
Condition:	<div><div><input type="radio"/> is initialized</div><div><input type="radio"/> is not initialized</div><div><input type="radio"/> has changed</div><div><input checked="" type="radio"/> hasn't changed</div></div> <div>Options has changed and hasn't changed are supported by all custom fields and only some system fields.</div>
Skip validation when: <small>Inhibit the validator under selected circumstances.</small>	<div><input type="checkbox"/> Transition is triggered by a bulk operation.</div> <div><input type="checkbox"/> Transition is triggered by a JIRA Workflow Toolbox post-function.</div> <div><input type="checkbox"/> Current issue is being created by cloning. Only makes sense in <i>Create Issue</i> transition.</div>
Message to show when validation fails:	<div>Changing the value of "My Date" field is not allowed.</div> <div>Field code injector: <div>Summary - [Text] - %(00000)</div><div>Field codes with format %(nnnnn) can be inserted in the failure message and its translations, and they will be replaced with actual field values at runtime.</div><div>Set translations for installed languages</div></div>

SINCE VERSION 2.5.0

Since JWT [version 2.5.0](#) it is possible to choose that all values in a multi-valued field have to be checked:

Field to be checked:	<div>Checkbox - Issues to be created - (Checkboxes) - [10801] ?</div> <div>For cascading select custom fields both levels are required to be initialized.</div> <div><input type="checkbox"/> Make all multi-value field options required</div> <div>If checked, all options in a multi-value field are required (apart from user/ group fields).</div>
Condition:	<div><input checked="" type="radio"/> is initialized</div> <div><input type="radio"/> is not initialized</div> <div><input type="radio"/> has changed</div> <div><input type="radio"/> hasn't changed</div> <div>Options has changed and hasn't changed are supported by all custom fields and only some system fields.</div>
