

# Condition based on cascading select list value

This condition evaluates the **comparison** of a given **value** against an **option** of a **cascading select list** field.

## Configuration

### Field

Select the cascading select list **field** to be checked.

### Option level

Select the **option level** to be checked. Cascading select list fields can potentially have **two levels**:

- Parent
- Child

### Comparison operator

Select **how** to compare the value against the given cascading select field options. The following options are available:

- is equal
- isn't equal
- contains
- doesn't contain
- starts with
- doesn't start with
- ends with
- doesn't end with

### Comparison value

Specify the **value** the option should be compared against in [Basic text mode](#).

Learn more about the possibilities of the [JWT expression editor](#).

The condition will be met if **any** of the specified options match the comparison.

## Use cases and examples

### Use case
