Use case

Often it is necessary to **keep parent issues and sub-tasks in sync**. To do so, the following automation rule comes with a handy configuration that automatically updates specific sub-tasks' field values with their corresponding parent issue's value.

In our use case we want to automatically update the **priority** field.

Field changed event

1

Create a **new rule** and name it appropriately.

Providing a description will help you to identify what the rule does but this step is **optional**.

2

Add a **Trigger** **Field Changed Event**

1

Field

Choose **Priority**

2

Changed to

Choose **Any value**

Issue selector

3

Add **Selector** **Issue selector** **Sub-tasks**

No further configuration needed.

Update field configuration

4

1

Next to **Issue selector** click on **Add Action Update Field**

2

Field

Choose **Priority**

3

Update to

Choose **Value returned by parsed expression**

4

Parser Expression

```
#{trigger.issue.priority}
# Since we want to get the value from that issue that is triggering the rule,
we add the "trigger" prefix.
```

Both **basic text** and **advanced text parsing modes** work for this expression.

5

Enable the rule by clicking on the **Enable button**

Screencast

This is how the configuration above should look on your screen

Your browser does not support the HTML5 video element

Import the example

Import the **JSON** file below to get started in no time

JSON

After importing the JSON file, make sure to **check the configuration** of the rule. Non-existing configuration elements (issue types, fields, values etc.) will be highlighted.
