

Project event

The **Project event** trigger executes a rule whenever a **specified project event** occurs.

Project event configuration

Simply select one of the available **Jira project** events. The rule will be executed when that event is being picked up by the automation rule.

List of available project events:

The following is a list of the available project events in your Jira instance:

- Component created
- Component deleted
- Component merged
- Component updated
- Version created
- Version deleted
- Version merged
- Version moved
- Version released
- Version unreleased
- Version updated

Project

Optionally select one or more projects. Only project events in the **selected projects** will be picked up by the rule.

If the **project selection** is **empty**, the rule is executed **every time the event** is being fired - regardless of the project.

Use cases and examples

Title	Automated action	JWT feature	Label
Notify assignees when components are merged	Add comment action		
Transition affected issues when releasing a version (automatically)	Transition issue action		STAFF PICK
