

Issue version selector

The **Issue version selector** is only available [when a version-related project event trigger](#) was configured.

The selector will return all issues containing the **specified versions**.

Issue version selector configuration

Below you will find a detailed description of each parameter needed to configure the condition.

Version fields*

Select the **version** field from the **trigger** context that should be used to select the **specific issues**.

Run as

Select the user that will be used to execute this action.

Only issues that this user is able to **view** (e.g via permissions, security levels) will be selected.

Use cases

Use case	Automated action	Use case description	Complexity
Transition affected issues when releasing a version (automatically)	Transition issue	Automatically transition all unresolved issues with a Fix Version that is being transitioned to <div>DONE</div>	<div>BEGINNER</div>

If you still have questions, feel free to refer to our [support](#) team.
