Use case

Often it is necessary to **keep parent issues and sub-tasks in sync**. To do so, the following automation rule comes with a handy configuration that automatically updates specific sub-tasks' field values with their corresponding parent issue's value.

In our use case we want to automatically update the **priority** field.

Field changed event

1

Create a new rule and name it appropriately.

Providing a description will help you to identify what the rule does but this step is **optional**.

2

Add a **Trigger** **Field Changed Event**

1

Field*

Choose **Priority**

2

Changed to*

Choose **Any value**

Issue selector

3

Add **Selector** **Issue selector** **Sub-tasks**

No further configuration needed.

Update field configuration

4

1

Next to **Issue selector** click on **Add Action Update Field**

2

Field*

Choose **Priority**

3

Update to*

Choose **Value returned by parsed expression**

4

Parser Expression*

```
%{trigger.issue.priority}
# Since we want to get the value from that issue that is triggering the rule,
we add the "trigger" prefix.
```

Both **basic** and **advanced parsing modes** work for this expression.

5

Enable the rule by clicking on the **Enable button** ☐ ☒

Screencast

This is how the configuration above should look on your screen

Your browser does not support the HTML5 video element
