

setBoolean()

This function creates a variable for storing a **boolean** value, and directly **sets** a **value**.

This value will be immediately returned and can be accessed by the [getBoolean\(\)](#) function afterwards **within the same expression**.

Syntax

```
setBoolean(variableName, value) #Output: Boolean
```

Examples

Expression parser	Description
<pre>setBoolean("myBoolean",true)</pre>	This example creates the variable " myBoolean ", sets the boolean value true and returns it accordingly.

Additional information

Parameters used in this function

Parameter	Input (data type)	Description
variableName	<input type="text" value="TEXT"/>	A text for the variable name.
value	<input type="text" value="BOOLEAN"/>	A JWT expression, which must return a boolean value of true or false.

Output

This function returns a

To **retrieve** the value stored in the variable, use the function [getBoolean\(\)](#) **within the same expression**.
