

# getBoolean()

This function returns the value stored in a **boolean variable**, which was previously created using the [setBoolean\(\)](#) function.

## Syntax

```
getBoolean(variableName) #Output: Boolean
```

## Examples

Expression parser	Description
getBoolean("myBoolean")	This example returns the value stored in the variable named "myBoolean", e.g.: true

## Additional information

Parameters used in this function

Parameter	Input (data type)	Description
variableName	TEXT	The name of the stored variable.

## Output

This function returns a BOOLEAN

To return the value you **must have created** the **variable** before, using the [setBoolean\(\)](#) function **within the same expression**.
