

# Temporary text

Field code
<code>%{issue.temporaryText1} ... %{issue.temporaryText5}</code>

## Read

Returned value	Text previously <b>stored</b> in the temporary field
Output data type	<div>TEXT</div>
Example output	This is a text stored temporarily

## Write

Valid text input	Unlimited text
Valid numerical input	Numbers are <u>cast</u> to text
Example input	This is a text stored temporarily

There are **5 temporary text fields**.

- `%{issue.temporaryText1}`
- `%{issue.temporaryText2}`
- `%{issue.temporaryText3}`
- `%{issue.temporaryText4}`
- `%{issue.temporaryText5}`

These fields are used to **hold temporary text values** returned by a **post function**, which can be used in a **subsequent post function** within the same workflow transition.

**Post functions** using temporary text fields via additional options:

- [Create issue](#) - store issue keys from the issue(s) to be created in the field temporary text 3.
- [Send email](#) - store email information, e.g. recipients, subject or body, in the fields temporary text 1 to 5.

Please note that:

- once a **transition** execution has **ended**, all temporary fields are **cleared**.
- you **cannot** use temporary fields to pass values from **one transition to another**.
