

Sprint end date

Field code
<code>%{issue.sprintEndDate}</code>

 Read

Returned value	End date of the current issue's sprint 
Output data type	<div>TEXT</div>
Example output	2020-02-17 07:46

If the issue is assigned to an **active sprint**, the value of this sprint will be returned.

If the issue is related to **several sprints**, the value from the currently active sprint will be returned.

If the issue is related to **several sprints** and all **sprints are inactive**, the value from the sprint completed most recently will be returned.

When cast to text, the output depends on the `jira.date.time.picker.java.format` parameter set in your Jira instance.

19/Mar/20 1:38 PM would be returned for `dd/MMM/yy h:mm a`

If you want to return a **number** (a timestamp) instead, **remove** the leading `%` character in front of the field code.

You will **not** be able to do this in the **basic mode**. Learn more about [Parsing modes](#).
