# Automation actions

**Actions** are the **heart** of an automation rule - they determine the type of:

- **field**,
- **issue**,
- **transition**,
- **comment**, or
- **email**

**processing** that should take place.

One or more actions can directly follow any trigger, condition, or selector and you can **add as many actions as needed**.

## Available automation actions

The following automation actions are currently available:

Add comment action

Assign issue action

Create issue action

Create issue link action

Delete issue action

Delete issue link action

Log work action

Reindex issue action

Send email action

Transition issue action

Update field action

The options actually available **depend** on which other elements (**triggers** and/or **selectors**) have been selected upfront. You might want to have a look at the element hierarchy.

If you don't have an issue context (e.g. because you have configured a project event) the Create issue action will be the only available action.

SCHEDULED

Run as    Demo User

Schedule    Daily at 1:00 am

JQL SELECTOR ▾

Select issues in JQL

project = DEMO

The issues are selected as CURRENT USER .

For each issue returned by the selector:

TRANSITION ISSUE ▾

◆ ISSUE REQUIRED

This module requires an issue provided by an issue-related trigger or a selector.

Please change your trigger accordingly, place this module below a selector or remove this module.

Transition issue to status DONE

This action will be run as Demo User.
