Condition on JWT project property

This condition evaluates the **value** of JWT project property.

The main benefit of using and comparing project properties is, that a **workflow** can be **shared across multiple projects**, but the behavior or the possible transitions are depending on the individual projects.

⚙️ Configuration

Property key

Specify the **key** of the JWT project property that should be checked in Basic text mode.

Property value

Specify the **property value** that should be checked against in Basic text mode.

Operator

Select **how** to compare the value against the given project property. The following options are available:

- is equal
- isn't equal
- contains
- doesn't contain
- starts with
- doesn't start with
- ends with
- doesn't end with

📁 Use cases and examples

Use case	JWT feature	Workflow function	Parser functions	Label
Only user specified in project property is allowed to execute transition		Condition on JWT project property	projectProperty()	
		Validation of JWT project property
