

Except users in a field

This condition **prevents users** or **groups** stored in a **field** from executing the transition.

 Configuration

Field

Select the field containing the users, either individual users or entire groups.

Text fields should contain a **single user**, **group name**, or a **comma-separated list** of user names or group names.

Do not confuse the **user name** with the **user's full name**.

This condition is the counterpart of the [Only users in a field](#) condition, which ensures that **only** specific users stored in a field can execute a transition.

 Use cases and examples

Use case	JWT feature	Workflow function	Parser functions	Label
Hide transition from issue creator		Except users in field
