

Users are/aren't in project role (validator)

This validator evaluates the **project role** membership of a **user or multiple users** stored in a **custom field** or a **system field**.

Configuration

Source field

Select the **field** containing the users that should be checked.

When a **Group Picker** (single or multiple groups) is selected, **all users** in the group(s) are evaluated.

Mode

Further refine the project role membership using the following options:

- **All users** in field are **at least in one of** the selected project roles
- **All users** in field are **at least in each of** the selected project roles
- **All users** in field are **at least out of one** in the selected project roles
- **All users** in field are **in none** of the selected projects
- **At least one** user in field is **at least in one** of the selected project roles
- **At least one** user in field is **in each** of the selected project roles
- **At least one** user in field is **at least out of one** of the selected project roles
- **At least one** user in field is **in none** of the selected project roles

Project role

Select the **project roles** to be evaluated.

Additional options

Check **Source field must not be empty** if you want to ensure, that the **source field must** actually contain users. If the source field **is empty** the validator will **fail**.

If unchecked, the validator will **pass**, if the source field is empty and any of the "**All users...**" options is selected in the **Mode** parameter above.

Validation options

The validation can be **skipped** under certain circumstances Select **one** or **multiple scenarios** in which you want to **skip** the **validation** to ensure the correct execution of certain operations.

Option	Description
Skip validation for JWT post functions	If the transition is triggered by a JWT post function , e.g. through Transition issue , the validation will be skipped.
Skip validation for bulk operations	If the transition is triggered by a bulk operation , the validation will be skipped.
Skip validation for clone operations	If the create transition is triggered by a clone operation , the validation will be skipped.
Skip validation for mail handlers	If the create transition is triggered by a mail handler , the validation will be skipped.

Error message

You can **optionally** define a custom error message in case the validator **fails**, which will be shown to the user trying to execute the transition.

You have the following options:

Location

Define **where** the error message should be displayed. By default, the message will be shown at the **top** of the transition screen, or in case there is no transition screen, as a **popup**.

Alternatively, you can locate the message below any other field. This option **only makes sense**, if there is a **transition screen** defined for the specific transition.

Due to **limitations** in **Jira Service Management**, the location parameter will be **ignored** on Jira Service Management related screens. The location parameter **only** works for the **Create Issue** transition screen if **JSD version 4.10** or higher is being used.

Message

Define the content of the error message in [Basic text mode](#) or [Advanced text mode](#).

Learn more about the possibilities of the [JWT expression editor](#).

In comparison to e.g. our [calculated custom fields](#) it is **not possible to display HTML** here. Displaying links to specific issues, for example, is not possible inside the error message.

Translations

After clicking on the **Add translation** button you can **optionally** translate the error message to other languages.

The language in which the error message will be displayed depends on the **language setting** of the individual **users**.

If you want to use this functionality in a **condition** instead, have a look at: [Users are/aren't in project role \(condition\)](#).

Use cases and examples

Use case	JWT feature	Workflow function	Parser functions	Label
Restrict the issue creation with specific issue types to certain project roles		Users are/aren't in project role (validator)		
Only users in a project role can execute a transition	 	Users are/aren't in project role (validator) Users are/aren't in project role (condition)
