

Predicted completion date of an epic

Use case

The prediction of the **completion date** of an **epic** is very useful for **reporting** and **planning** purposes.

This use case calculates the predicted completion date based on **cumulated remaining estimates** of all issues linked to each epic.

To calculate the remaining estimates, a second calculated field will be used, which is explained in this use case: [Total remaining estimate in an epic \(all linked issues\)](#)

Configuration

1

[Create](#) a new **Calculated Date-Time Field (by JWT)** custom field and name it appropriately.

Providing a description will help you to identify **what** the custom field does, but this step is **optional**.

2

Parser expression

Add the following expression:

Date/Time expression for Calculated Date/Time field:

```
addTimeSkippingWeekends(%{system.currentDateTime}, {issue.cf10200}*{DAY}, LOCAL, {FRIDAY}, {SATURDAY})
```

more info...

`{issue.cf10200}` is the field code for the calculated field **Epic Remaining**. See this use case on how to calculate this value: [Total remaining estimate in an epic \(all linked issues\)](#)

Additionally to the [JWT calculated number field](#) this example uses the `addTimeSkippingWeekends()` function.

3

Display Format

1

Format type

Choose **Date Time Picker**

4

Add the field to the relevant view **screens**.

Remember: All calculated fields are **read-only** and cannot be manually updated on a create or edit screen.

5

Check the results

Once configured and added to an issue screen (e.g. an epic), the result will look like this:

 Development / DEV-4
