

Time left before the issue is due

Use case

This calculated field returns the **time left** before an issue is **due**, if a due date has been set.

Configuration

1

[Create](#) a new **Calculated Number Field (by JWT)** custom field and name it properly.

Providing a description will help you to identify what the custom field does but this step is **optional**

2

Parser expression

Add the following expression:

Math expression for Calculated number field:

```
{issue.dueDate} != null ? max({issue.dueDate} - {system.currentDateTime}, 0) : null
```

more info...

To achieve this, the following functions are used:

- Conditional operator
- [max\(\)](#) is used to avoid returning a **negative** duration when the **Due date** has passed.

3

Display format

1

Choose **Duration** as **Content type**

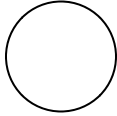

2

Choose **Short** as **Duration display format**

more info...

For this use case the format **duration** was chosen, since the numeric value being calculated, a number of milliseconds, represents a time duration.

This way the value is represented like **2d 9h 43m** instead of a single number.

Check the parameter **Uninitialized when calculated value is zero**

more info...

This parameter is set to stop calculation **once** the Due Date has been reached.

4

Add the field to the relevant view **screens**.

Remember: All calculated fields are **read-only** and cannot be manually updated on a create or edit screen.

5

Check the results

Once configured and added to an issue screen, the result will look like this:

Default Configuration Scheme for JWT calculated field

Default configuration scheme generated by Jira

Applicable contexts for scheme: [Edit Configuration](#)

Issue type(s):

Global (all issues)

Expression:

✓ 123 `{issue.dueDate} != null ? max({issue.dueDate} - {system.currentDateTime}, 0) : null`

[Edit expression](#)

Display format: **Duration** with **short** format.

Field will be considered as **uninitialized** (i.e. will return null) when calculated value is **zero**
