# projectsWhereTextProperty()

This JQL function returns projects with specific properties containing a text value.

#### Syntax

projectsWhereTextProperty(propertyName, operator, value) #Output: Text list

### Examples

Parser expression	Description
<pre>project in projectsWhereTextProperty ("country", "=", "Spain")</pre>	This example returns a list of projects where the project property <b>country</b> is equal to <b>Spain</b> , i.e. text <b>{country=Spain}</b> is present in the project's description.
<pre>project in projectsWhereTextProperty ("country", "matches", "France Germany")</pre>	This example returns a list of projects where the project property <b>country</b> matches the regular expression <b>France Germany</b> , i.e. text <b>{country=France}</b> or <b>{country=Germany}</b> are present in the project description.
<pre>project in projectsWhereTextProperty ("country", "~", "spain")</pre>	This example returns a list of projects where project property <b>country</b> is equal to <b>spain</b> , <b>SPAIN</b> , <b>S pAiN</b> , etc.

## Additional information

Parameters used in this function

Parameter	Input (data type)	Description
propertyName	ТЕХТ	The name of a project property containing a text value.
operator	ТЕХТ	A valid comparison operator.
value	ТЕХТ	The text value used for searching or a regular expression in the case of the matches operator.

#### Output

This function returns a TEXT LIST

The result is not what you expected? The number of returned issues feels too low?

By default, the **maximum number** of issues that will be returned by the JQL subquery, and thus can be processed by the logical expression is **1** 000.

To ensure the performance of your entire Jira instance, we limit the execution of the JQL function in terms of **issue count** and **execution time**. Please refer to your admin if you need to change the configuration.
