

Copy field values from multiple issues

This post function allows you to **copy** field values from **one** or **multiple issues** which are returned by an **issue list** or a **JQL query**.

Field values can also be **aggregated** or **calculated**. Make sure to familiarize yourself with the [JQL mode](#) and the [Issue list mode](#) which are used to define the target list of issues to copy values from.

Configuration

Target field

Select the **target fields** that will be set and the **source values** for each of them. The following options are available:

Option	Description
Copy field from selected issues	<p>The value(s) found in the issues specified in the next parameter "Issues to copy from" will be copied to the target field as a comma separated list.</p> <p>Since you are copying the values of potentially multiple issues returned by a JQL query or an issue list JWT can aggregate values, and offers additional options depending on the type of source field.</p> <div><p>Calculated values</p><p>For date and date-time fields you can additionally choose to only return the:</p><ul style="list-style-type: none">• Earliest date value among those being returned.• Latest date value among those being returned.<p>For numeric fields you can automatically return the following aggregated values:</p><ul style="list-style-type: none">• Sum of values: sum of all the values being returned.• Lowest value: minimum value among those being returned.• Highest value: maximum value among those being returned.• Average value: arithmetic mean of values being returned.<p>When updating the Priority field you can additionally choose to only return the:</p><ul style="list-style-type: none">• Highest priority value among those being returned.• Lowest priority value among those being returned.</div>
Set field value manually (parser expression)	<p>Set the value of the target field using an expression and optionally use field codes. The Parsing modes differ depending on the data type of the target field.</p> <p>You can either choose from the Advanced text mode or the Numeric mode.</p>
Clear field value	Choose this option to clear the value of the target field . This option is not available for the Summary field.

Check the **write protection** option if you want to prevent a field to be updated, if it already has a value. If checked, only empty fields will be set.

Issues to copy from

Enter a **JQL query** or an **issue list** and optionally use [field codes](#) to define the **target list** of issues the values will be copied from.

Make sure to familiarize yourself with the [JQL mode](#) and the [Issue list mode](#)

Additional options

Choose to **update issues immediately** if you want Jira to fire a separate "Issue updated" event for any field change. This will also result in a dedicated **issue history** entry.

Conditional execution

You can **optionally** specify a [logical expression](#) to define the circumstances (or conditions) under which the post function should be executed.

The result of the logical expression must return a boolean value of either:

- **true** the post function will be executed
- **false** the post function will **not** be executed

Using the **conditional operator**, even complex or multi-layered conditions can be constructed.

Make sure to learn more about defining logical expressions and browse through the various **examples** here: [Logical mode](#)

Run as

Select which **user** will be used to execute this post function. By default this parameter is set to the **current user**. You can also use field codes to run the function as a dynamic user (e.g. current assignee).

Make sure that the user running the post function has all the **relevant permissions** to perform the actions defined in the configuration (e.g. "Update Issues")!

If you want to keep track the actions being performed automatically, we suggest to create a **dedicated JWT account**, granted all relevant **permissions**, and use it in the Run as parameter to identify which changes have been made with JWT.

Use cases and examples

Use case
