

# Post functions

Post functions can be used to **automate tasks** and **ensure** consistent **data quality** by eliminating or at least minimizing human error.

Jira ships with built-in **post functions** but those are limited. JWT extends that list by offering **custom post functions**.

## Available post functions

Jump right in and configure any of the available post functions listed below. Each post function comes with built-in examples.

If you are just looking for some **inspiration**, head over to our large use case library and check out our [Workflow use cases!](#)

Post function	Short description	Label
<a href="#">Add comment</a>	Add a <b>comment</b> to an issue.	STAFF PICK
