

Prevent issue creation with the same field value (Boolean)

On this page

[Configuration](#) | [Screenshots](#) | [Related use cases](#)

Use case

Prevent issue creation when there is already another issue in the same project with the same value in a certain field.

In this use case let's suppose that we have a text custom field called **Invoice**, and we want to avoid this field's value to be repeated among issues of the same issue type in the same project.

This use case is based on the [Prevent issue creation with the same field value](#) with [Validation based on JQL query](#).

Configuration

1

Add the [Logical validator](#) to the "Create issue" transition of the desired workflow.

2

Expression

Add the following expression:

```
count(issuesFromJQL("project = '" + issue.project.key + "' AND issuetype = '" + issue.issueType + "' AND Invoice = '" + issue.cfnnnnn + "'")) = 0
```

`%{issue.cfnnnnn}` is the field code for the custom field **Invoice**. You might need to update the expression accordingly to the custom field you want to use.

Screenshots

Update parameters of the 'Logical validator' Validator for this transition.

Update parameters of the 'Logical validator' Validator for this transition.

Basic configuration*

Define the required parameters for this validator.

Expression*

```
1 count(issuesFromJQL("project = '" + ${issue.project.key} + "' AND
issuetype = '" + ${issue.issueType} + "' AND Invoice = '" +
${issue.cf13600} + "'")) = 0
```

The expression must return true or false. The condition is met if the logical expression returns true.

- > Error message

Logical validator

Documentation

Evaluate a logical expression that returns true or false - a most universal and powerful function to compare field values across any kind of issue relation, count sub-tasks or links.
