Google Maps location

Use case

This calculated field returns the **Google maps** location for a given **address**.

⚙ Configuration

1 [Create](#) a new **Calculated Text Field (by JWT)** custom field and name it properly.

> Providing a description will help you to identify what the custom field does but this step is **optional**

2 **Parsing mode**

Select **Advanced text** as parsing mode.

3 **Parser expression**

Add the following expression:

Text to be parsed for Calculated Text Field:

```
%{issue.cf10407} != null ? "<iframe width=\"100%\" height=\"500\" id=\"gmap_canvas\" src=\"
https:\/\/maps.google.com\/maps?q=" + replaceAll(toLowerCase(%{issue.cf10407})," ","%20") +
"&t=&z=13&ie=UTF8&iwloc=&output=embed\" frameborder=\"0\" scrolling=\"no\" marginheight=\"0\"
marginwidth=\"0\"><\/iframe>" : null
```

more info...

> **%{issue.cf10407}** is the field code for the custom field **Address**, which is a text Field (single line). The field in the example simply contains: "**Atlassian Sydney**".
4 **Add** the field to the relevant view **screens.**
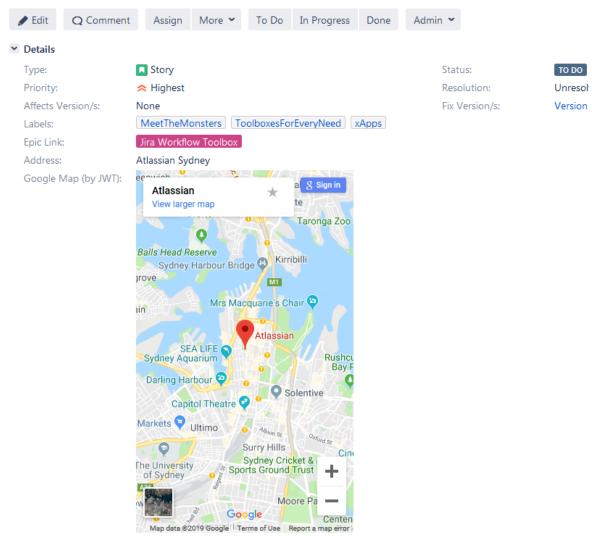

> **Remember**: All calculated fields are **read-only** and cannot be manually updated on a create or edit screen.

5 **Check the results**

Once configured and added to an issue screen, the result will look like this:

Google Maps location for an address
