Resolution

Field code
`%{issue.resolution}`

Read

Returned value	**Name** of the current **resolution**
Output data type	TEXT
Example output	Resolved

The name of the resolution will be returned in **Jira's default language**. If a **translated** value should be returned in general this setting can be updated in the configuration of the xApps library.

If the issue has **no resolution**, an empty text will be returned.

Write

Valid text input	A valid **resolution name** (e.g. Fixed, Won't Fix, Duplicate, Incomplete, etc.)
Valid numerical input	
Example input	Fixed
