

Highest ranked custom field value among all linked issues

Use case

This calculated field returns the **highest value** of a specific **custom field** among all linked issues.

In this example, the **Story Points** are returned. The Story points are stored in another custom field called **Story Points**.

Configuration

1

Create a new **Calculated Text Field (by JWT)** custom field and name it properly.

Providing a description will help you to identify what the custom field does but this step is **optional**

2

Parsing mode

Select **Advanced text** as parsing mode.

3

Parser expression

Add the following expression:

Text to be parsed for Calculated Text Field:

```
first(sort(fieldValue(%{issue.cf10409}, linkedIssues()),DESC))
```

more info...

`%{issue.cf10409}` is the field code for the custom field **Story Points**.

To achieve this, the following functions are used:

- `first()`
- `sort()`
- `fieldValue()`
- `linkedIssues()`

4

Add the field to the relevant view **screens**.

Remember: All calculated fields are **read-only** and cannot be manually updated on a create or edit screen.

5

Check the results

Once configured and added to an issue screen, the result will look like this:

Default Configuration Scheme for JWT calculated field

Default configuration scheme generated by Jira

Applicable contexts for scheme: [Edit Configuration](#)

Issue type(s):

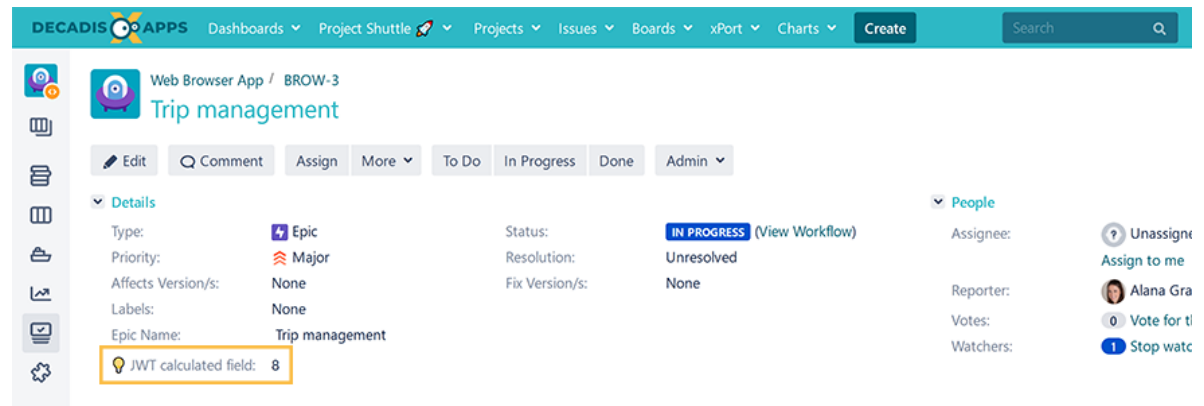

Global (all issues)

Expression:

  `first(sort(fieldValue(%{issue.cf10018},
linkedIssues()),DESC))`

[Edit expression](#)

Mode: Advanced text

The screenshot shows the Jira issue screen for 'Trip management' (Epic Name: Trip management). The 'Details' section shows the 'JWT calculated field' with a value of 8. The 'People' section shows the assignee as 'Unassigned' and the reporter as 'Alana Gra'. The 'Status' is 'IN PROGRESS' and the 'Resolution' is 'Unresolved'.
