

Product roadmap

We constantly improve the app and add new features.

To be as transparent as possible about what's happening around the app we decided to share an overview of our product roadmap with you.

We encourage you to send us your valued feedback in the app or through our support portal and influence the development of the product so it covers your needs.

Working on

Improving automated migration

With the support of the JCMA, JWT Cloud already offers [automated migration path](#). We are currently in the process of making migration even easier, focusing on improving JCMA integration and implementing more useful parser functions.

In the work

Additional post functions

We will be adding additional post functions to the product to extend the functionality of JWT for Jira Cloud.

Adding new expression parser functions

To close the gap to the on-prem version of JWT, we will further work on providing further expression parser functions.

Simple conditions & validators

We will add further conditions and validators that will allow you to implement even complex use cases with point-and-click ease.
