usersWithProperty()

This JQL function returns users that own a certain **user property.**

Syntax
`usersWithProperty(propertyName) #Output: Text list`

Examples

Parser expression	Description
`reporter in usersWithProperty ("supervisor")`	This example returns all issues where the current **reporter** has a **property** called **supervisor**, ignoring the actual value.
`assignee in usersWithProperty ("vpnAccess")`	This example returns all issues where the current **assignee** has a **property** called **vpnAccess**, ignoring the actual value.

Additional information

Parameters used in this function

Parameter	Input (data type)	Description
`propertyName`	TEXT	The name of the user property.

Output

This function returns a TEXT LIST

If you want to search for issues where a user has a **specific user property value**, have a look the the usersWithTextProperty(), usersWithNumericProperty() or usersWithDateTimeProperty() function.

The result is **not what you expected**? The number of returned issues feels **too low**?

By default, the **maximum number** of issues that will be returned by the JQL subquery, and thus can be processed by the logical expression is **1 000**.

To ensure the performance of your entire Jira instance, we limit the execution of the JQL function in terms of **issue count** and **execution time**. Please refer to your admin if you need to change the configuration.
