

Rules

Rules are basically **checks**, that can be combined and bundled in [Reports](#). Once a report is run against a timesheet, all **rules will be executed** against the selected timesheet.

Timesheet Check comes with basic **metrics** like the **length of working days** or **daily rest periods** to get started right away. Based on these metrics, rules are set up in minutes to map common regulations or policies.

A rule, apart from a **name** and an optional **description**, consists of three **key elements** - a **metric**, an **operator**, and a **value**.

The metrics are built-in, whereas the operators and values can be customized by the users.

In order to create or configure rules you need to have the ["Administer Jira" permission](#) or the ["Manage reports" permission](#).

Metrics

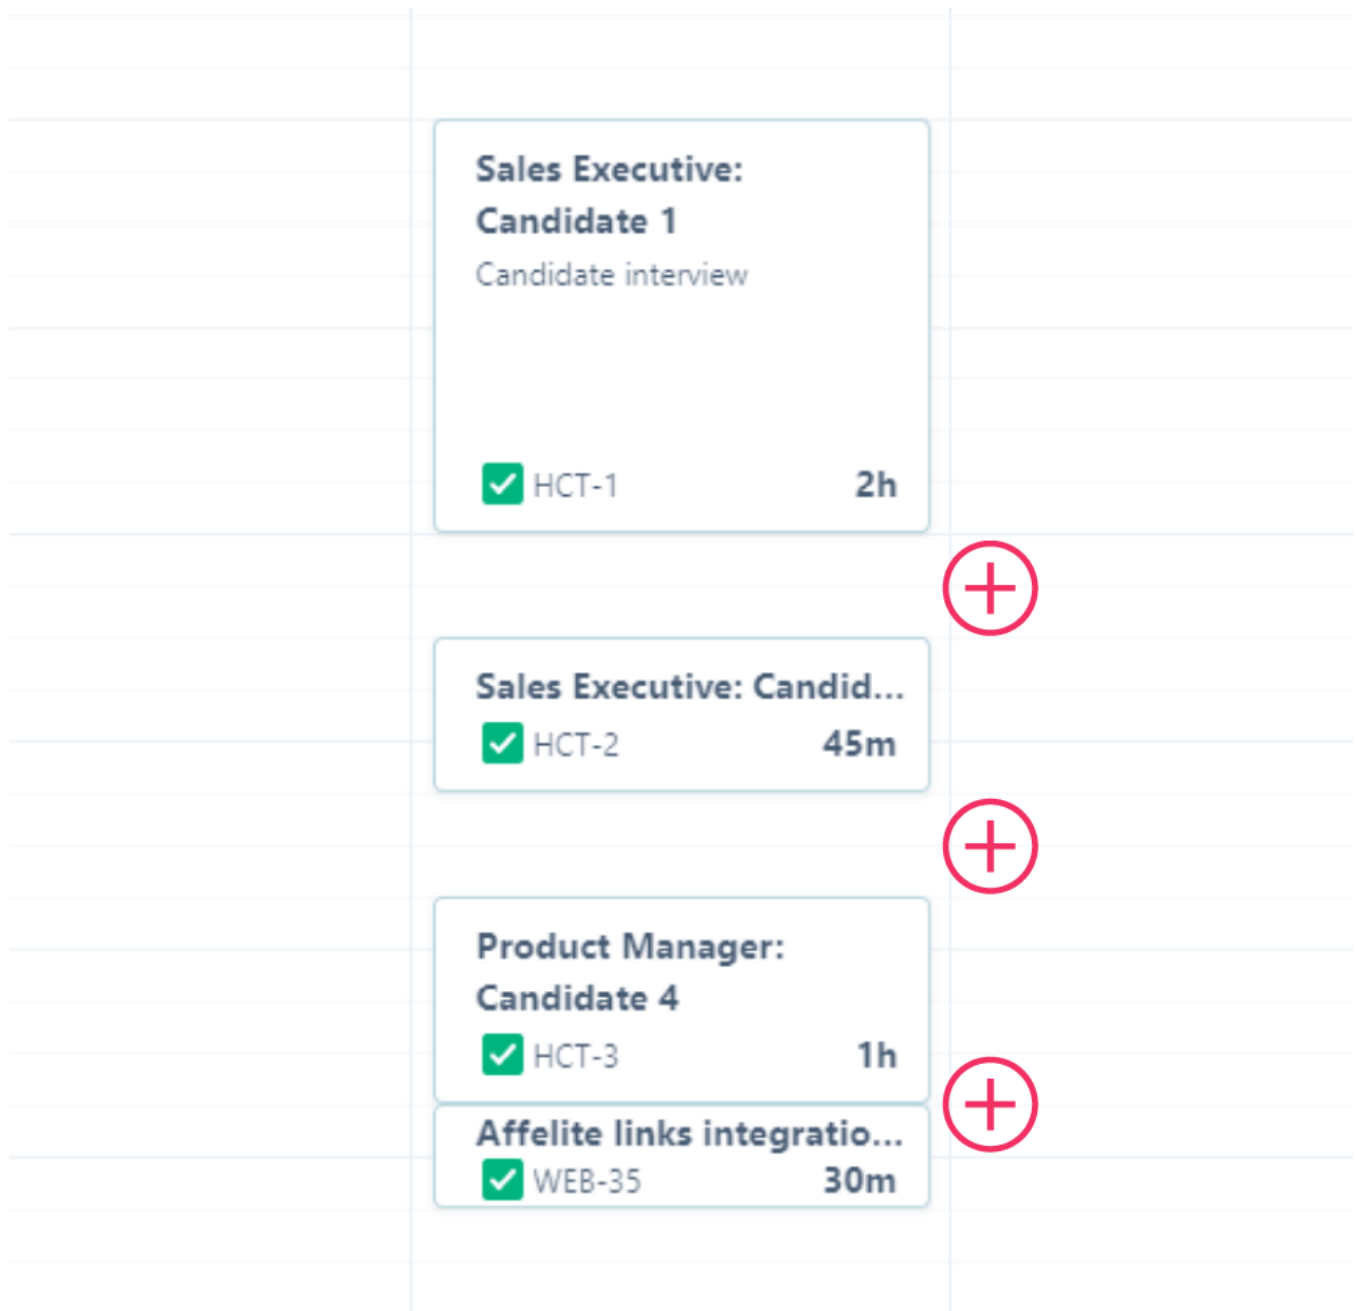

Metrics are the **building blocks** of a rule and can be seen as a framework, or a built-in check that defines what you can configure inside of a rule.

Working day

The **working day** metric lets you define the **minimum** or **maximum length** of a **regular working day**.

It accumulates the **total** of all time **logged on any given day**.

Example configuration

One of the [Preset rules](#) uses the working day metric to check whether users logged **more than 10 hours** on any given working day.

Create new rule - Working day

Name *

Maximum daily working hours

Description

Check whether the users have worked more than 10 hours on a given day.

Operator *

The operator compares the value you define in the next step with the metric you selected. 

<=

Working time *

Configure the number of **hours/minutes** that define a **working day**. 

Hours *

10

Minutes *

0

[Back](#)

[Submit](#)

Translation

The total of work logged on any given day **must be lower than or equal to (<=)** 10 hours and 0 minutes for the check to pass .

Working week

Using the **working week** metric lets you check whether your users logged the correct amount of time in a week.

You can either set a maximum or minimum for the week.

✓ You can e.g. create **two separate rules** using this metric to define a **specific range of work to be logged** in a week (at least x hours but at most y hours per week)

Example configuration

 **Edit - Maximum weekly working hours for students**

Name *

Description

Operator *
Select the comparison operator to be used. 
 

Working time *
Configure the number of **hours/minutes** that define a **working week**.

Hours * <input type="text" value="20"/>	Minutes * <input type="text" value="0"/>
--	---

Cancel

Working hours

The working hours metric lets you define a **specific timeframe** in which the users only are **allowed to log time**.

This way you can restrict e.g. logging time at night.

Example configuration

 **Create rule - Working hours**

Name *

Description

Working hours

A horizontal timeline with a sun icon on the left and a moon icon on the right. A blue line spans the width. Two blue dots are placed on the line, with callout boxes above them showing '07:30' and '19:30' respectively.

[Back](#)

Rest breaks

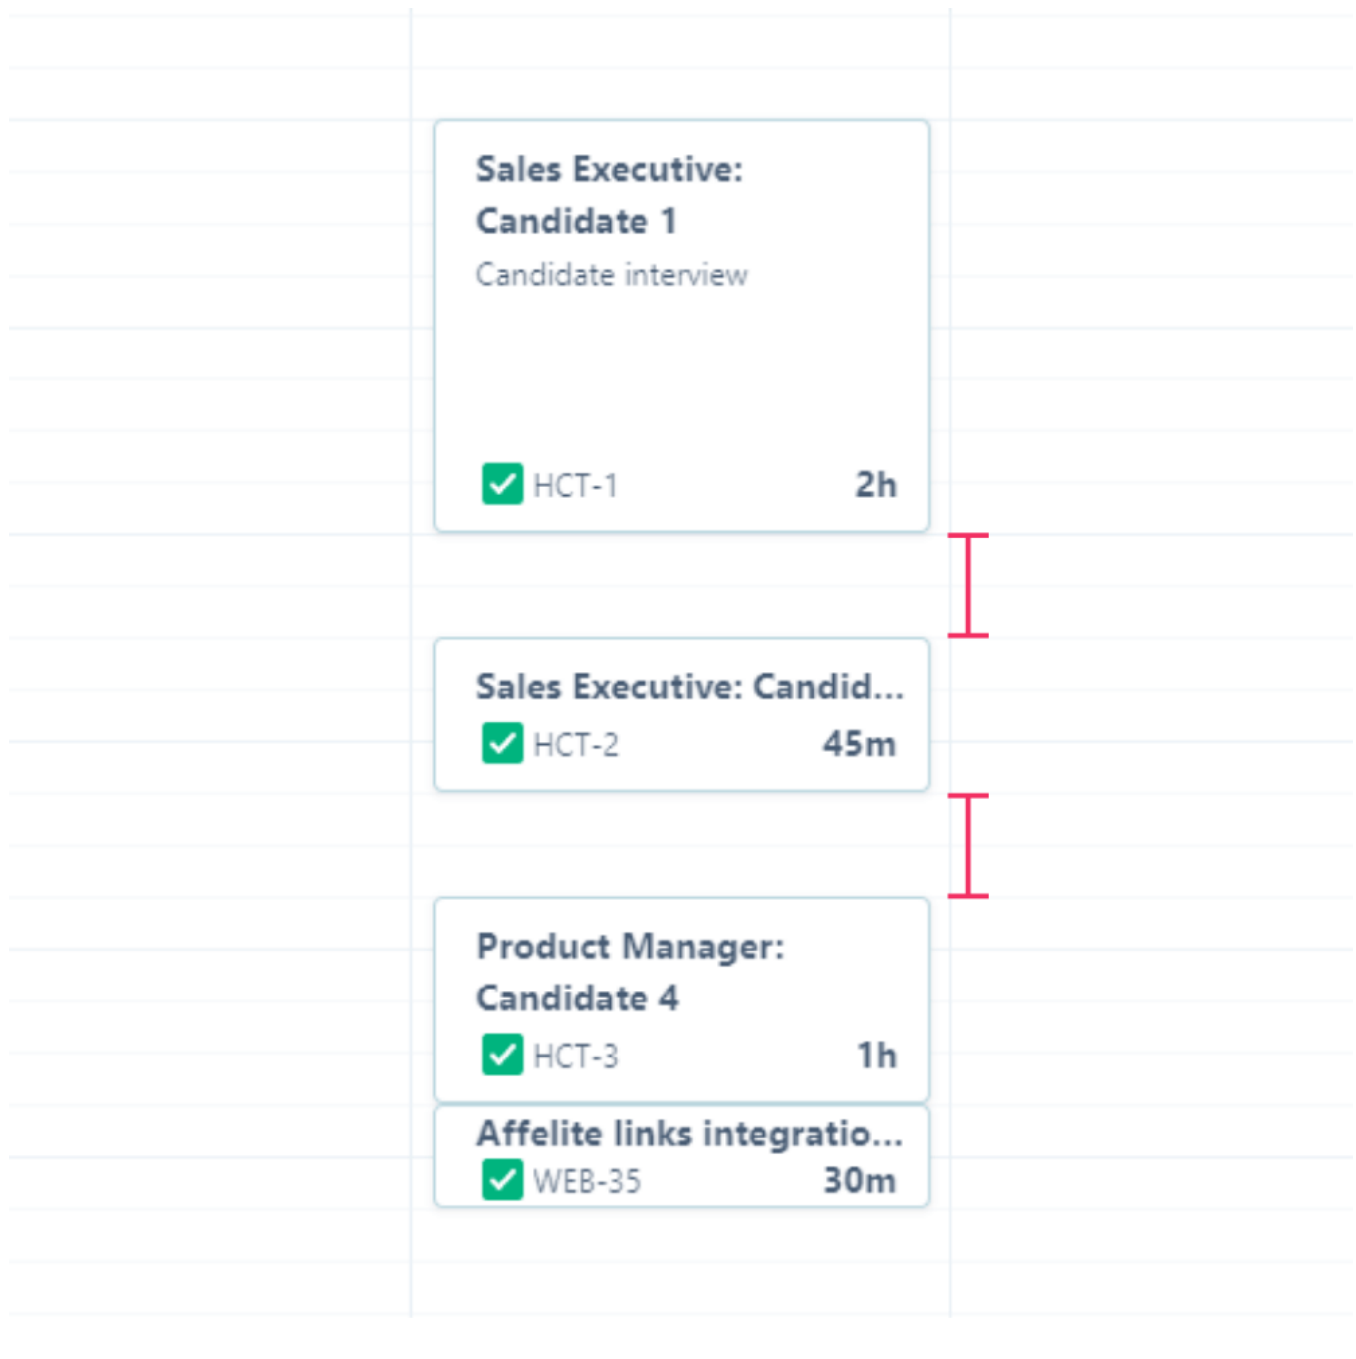

The **rest breaks** metric lets you define the **total duration** of the **rest break(s)** needed on a given working day.

It accumulates the **total duration between** work logs on any given day.

According to some regulations a break must have a minimum duration to be counted as such. The duration can be configured in the global [Settings](#).

The metric also checks whether consecutive work log entries and periods, that cannot be counted as a break, exceed the reference period in total.

Example configuration

One of the [Preset rules](#) uses the rest break metric to ensure that users have a **minimum of 30 minutes of rest breaks** when their **working day exceeds 6 hours**.

Edit Minimum daily rest break I

Name *

Minimum daily rest break I

Description

Check whether users have taken necessary rest breaks (>6 working hours per day).

Operator *

The operator compares the value you define in the next step with the metric you selected. 

>=

Rest break duration *

Define the **total duration of the rest break(s)** needed on a given working day as specified below.

Hours *

0

Minutes *

30

Reference period (working day) *

Configure the number of **hours/minutes** that define a **working day**. 

Hours *

6

Minutes *

0

Cancel

Submit

Translation

The total time **between** work logs **must be greater than or equal to (\geq)** 0 hours and 30 minutes if a user has **logged more than 6 hours** on any given working day for the check to pass .

Daily rest period

The **daily rest period** metric lets you define the **minimum length** of a **daily rest period**.

It measures the interval between the **End time** of the **last** worklog of any given day and the **Start time** of the **first** workload of the next working day.

Example configuration

One of the [Preset rules](#) uses the daily rest period to ensure that users have **rested for a minimum of 11 consecutive hours** between two working days.

 Edit Minimum daily rest period

Name *

Minimum daily rest period

Description

Check whether users have rested for a minimum of 11 consecutive hours.

Duration *

Define the **consecutive duration of the daily rest period** per 24-hour period needed on a given working day.

Hours *

11

Minutes *

0

Cancel

Submit

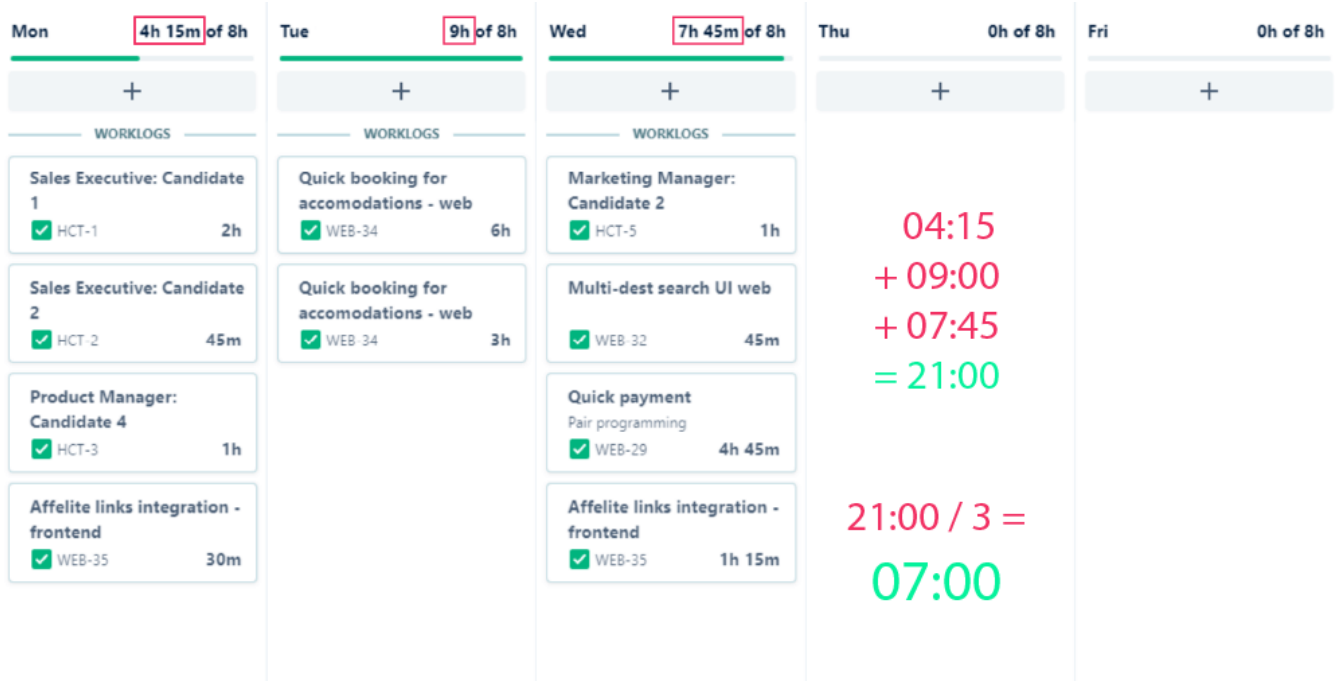

Average of work logged

The **average of work logged** metric lets you define the **minimum** or **maximum average working time** of a user.

It calculates the **average** daily working time (**total of time logged on any day**) over a given [Tempo period](#). The Tempo period will be selected once you execute this rule in [Reports](#).

In case of a failed check, all involved worklogs will be reported as failed, even if the daily working time might be valid for that particular day.

Example configuration

One of the [Preset rules](#) uses the average of work logged metric to ensure that the **average daily working time** does **not exceed 8.5 hours**.

Edit Maximum average working time

Name *

Maximum average working time

Description

Check that users have not worked more than 8.5 hours on average.

Operator *

The operator compares the value you define in the next step with the metric you selected. 

<=

Total work logged *

Configure the average number of **hours/minutes** that a user must have logged in the **reference period** specified below.

Hours *

8

Minutes *

30

Cancel

Submit

Translation

The total of work logged on any given day **must be lower than or equal to (\leq)** 8 hours and 30 minutes **on average** in a given Tempo period for the check to pass .

Create your first rule

1

Navigate to the **Rules** page in the Timesheet Check administration.

Need inspiration? Timesheet Check comes with some preset rules. Since they can be modified by anyone with adequate [permissions](#) we have listed them for you here: [Preset rules](#)

Your browser does not support the HTML5 video element

2

Click on **+ New rule**

3

Select a metric.

4

Select a **name** and optionally a **description**.

Rule descriptions will help you to identify the rule you are looking for in the future.

5

Configure the rule by selecting an operator and time definitions.

6

Submit your configuration.

* Disclaimer

Regulations and laws are subject to change. The preset rules are just meant to help you get started. A passed check does not mean that you are compliant with your local laws.

If you still have questions, feel free to refer to our [support](#) team.
