

Highlights

Analyze log files directly in the administration interface

Analyzing log files is the key to successful troubleshooting. With Last Log for Jira, you can finally analyze all log files directly in the Jira administration interface.

- All log files in a single location - Select the log file you want to analyze from a practical sidebar with dropdown menus.
- Don't lose focus - Use the tool bar to configure your log view and only view exactly the log entries you're looking for.
- [View thread dumps](#) - Access a current thread dump for your instance within seconds to analyze performance issues.

The screenshot shows the Jira Administration interface. The top navigation bar includes the 'decadis Demo' logo and a search bar. Below the navigation bar, the 'Administration' section is active, and the 'Log files' sidebar is open on the right. The main content area displays a list of log files with search and filter options. The log entries are filtered by 'LATEST' and show details for various Jira components like 'c.a.j.util.stats.JiraStats' and 'c.a.jira.servlet.ApplicationStateResolverImpl'.

Advanced search and filter options

The sheer number of log file entries can be overwhelming and it's easy to miss the exact information you are looking for. Not anymore!

- Advanced search - Search for specific log entries with case sensitive search and regular expressions.
- Filter your output - Configure advanced filters using log level, user name or timeframe of the log entries.
- Limit shown log entries - Limit your output to focus on the essential by using a practical tool bar.

Activate the live view and let your logs be automatically refreshed

By using the tool bar in the log view interface, you can [activate a live view](#) of your logs with a single click!

- View your logs almost in real-time with a refresh every 5 seconds.
- New log entries appear automatically, so you can continuously analyze your log.
- Easily deactivate the live view again to focus on the current log entries.
