JWT release notes 3.1.0

JWT 3.1.0 was unpublished due to potential **conflicts** caused by the newly introduced **linkedIssuesOf() JQL function**.

Only customers also using **ScriptRunner for Jira** were affected.

The JQL function was renamed to **linkedTo()** in **JWT 3.1.1** which remedies any potential problems.

Release date	30 Sep 2021
Release type	FEATURES
Highlights	See JWT 3.1.1

New features

- Introducing new **JQL functions** to improve issue search, e.g. **usersWithRoleInProject()**, **users WithProperty()**, **linkedIssuesOf()** or **issueSelection()**
- Extended support for **Advanced Roadmaps** related **fields** paired with additional **expression parser functions**

Improvements

- Improved handling of the **Customer Request Type** field for several post functions
- Improved **form validation** for editing validators, conditions and post functions
- Improved usage of **logging levels** regarding the evaluation of **calculated fields**
- Introducing **anonymized app metrics**

Bug fixes

- Validation on linked issues was missing the Epic option
- Setting the security level did not work properly for subtasks created by the Create issue post function
- Setting a select list (multiple choices) with the value of a select list (single choice) did not work properly
- Certain parser expressions could lead to corrupted Configuration Manager snapshots
- Adding issue links with a conditional execution could break the create issue edit screen
- The textOnIssueList() function was not working properly when used in the Update or copy issue fields post function
- Updating an Insight Referenced Object custom field did not work properly
- Deleting the user that created an automation rule could break its configuration screen
