

JWT release notes 3.1.2

Release date	28 Oct 2021
Release type	MAINTENANCE
Highlights	Maintenance release

Improvements

- Improved and extended version of the **in-app handbook**
- Improved **form validation** for several post functions and automation actions in order to prevent misconfiguration
- Improved **support of seed values** and field codes for several post functions
- Improved **performance** of the [Assign to project role](#) post function and [isInRole\(\)](#) function for instances with a large user count
- Warning message added when executing a [Transition issue](#) post function with an empty string as transition name

Bug fixes

- [Temporary text fields](#) did not work properly when being used in the [Add comment](#) post function
- The [isJwtTriggeredTransition\(\)](#) function did not work properly for issues created by the [Create issue](#) post function and the [Create issue action](#)
- The [leastBusyUserInRole\(\)](#) function did not work properly when inactive users were in the given role
- The [isInGroup\(\)](#) function did not work properly when renamed users were in the given group
- The [shortFormatDuration\(\)](#) function returned wrong results for some input values
- JQL expressions could lead to corrupted Configuration Manager snapshots
- Field codes were shown incorrectly for several post functions on the target instance after importing a Configuration Manager snapshot
- Field codes of custom fields with IDs larger than 50000 did not work properly
- The [Transition issue](#) post function did not work properly for sub-task issue types
- The usage of the Update issue immediately option was not reflected properly in the view for several post functions
- Updating multi-value fields did not work properly for several post functions
