

# minute()

This function returns the **minutes** part of a timestamp based on a given time zone.

## Syntax

minute(timestamp, timeZone) #Output: Number

## Examples

| Parser expression                                                                         | Description                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>%{minute({issue.created}, RUN_AS_LOCAL)}</code>                                     | This example returns the <b>minute</b> part of the <b>issue creation date</b><br><div> If the issue was created on <b>March 25th, 2020 23:15:30</b> the output would be <b>15</b>.</div> |
| <code>%{minute(stringToDate("2020-01-01 00:30:00", "YYYY-DD-MM hh:mm:ss"), "UTC")}</code> | This example uses the time zone <b>UTC</b> , it returns: <b>30</b>                                                                                                                                                                                                        |

## Additional information

Parameters used in this function

| Parameter | Input (data type)                   | Description                                                                                                                                |
|-----------|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| timestamp | <input type="text" value="NUMBER"/> | The parameter must be valid <b>timestamp</b> . Usually this value is retrieved from a <a href="#">field</a> (e.g. due date, created date). |
| timeZone  | <input type="text" value="TEXT"/>   | The <b>time zone</b> used for the calculation.                                                                                             |

## Output

This function returns a
