

# Date and time of last status change

## Field code

```
%{issue.lastStatusChange}
```

## Read

Returned value	Date and time of the most <b>recent status change</b> of the issue
Output data type	<input type="text" value="TEXT"/>
Example output	19/Mar/14 1:38 PM

When cast to text, the output depends on the `jira.date.time.picker.java.format` parameter set in your Jira instance.

**19/Mar/20 1:38 PM** would be returned for `dd/MMM/yy h:mm a`

Want to find out **how long** an issue has been **in the current status**? Try the function [timeInStatus\(\)](#)

If you want to return a **number** (a timestamp) instead, **remove** the leading `%` character in front of the field code.

You will **not** be able to do this in the **basic mode**. Learn more about [Parsing modes](#).
