

Smart Fields for Jira release notes 1.0.0

Different types for different needs

Smart Fields for Jira ships with two **universal** and dynamic custom **field types** for all kinds of needs. Instead of flooding your Jira site with many potentially unused and unneeded field types, you only need to create and configure a smart field when you really need it.

What you want to see as output is entirely up to you. The expression editor best known from our best-rated Jira app [Jira Workflow Toolbox \(Cloud\)](#) will surface the data you need and display the results in one of the following field types:

- [Smart number fields](#) to display e.g. the number of open subtasks, unresolved or blocking issues and many more
- [Smart text fields](#) to display e.g. additional details of the issue creator, historic due dates and many more

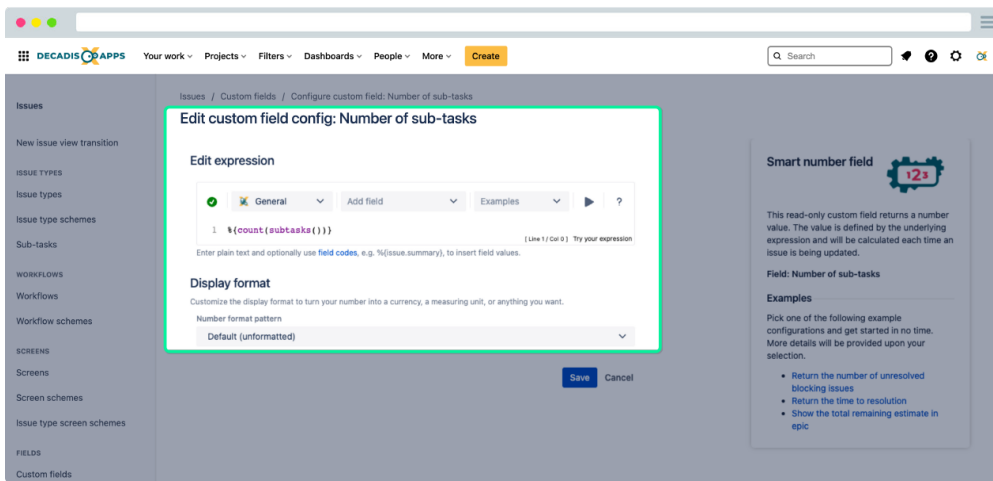

Dynamic values - take the "static" out of your data

No more **unnecessary clicks and searches**: [Smart Fields](#) was designed to effortlessly visualize information that was hidden under the hood.

Results are being updated **dynamically** every time you load an issue, so the information you seek is always **live**.

The spectrum ranges from simply displaying text from various sources, such as issue **comments from liked issues**, to complex calculations of accumulated **time spent on related epics**.

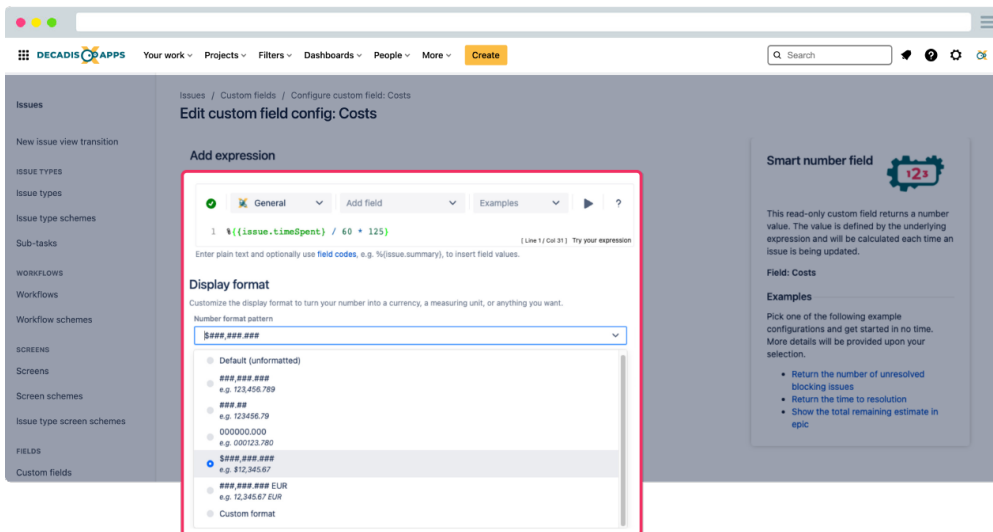

Why smart?

It's not only about just displaying existing data, you can **manipulate it too**. Using the power of the **JWT expression editor**, you can **customize** and **enhance the data** the way you need it.

From automatically **adding days** to an expected due date to **calculating project costs** based on hourly rates.

Using additional **Display formats** you can even define **what** the output will look like - adding a **currency** or weight **unit** has never been easier.

Troubleshooting made easy

Every execution of Smart Fields is being tracked in a dedicated **Execution log**.

So you no longer need to dig deep into Jira when hunting for bugs in your expressions.
