

Reindex issue on custom field update

On this page

[Field changed event](#) | [Reindex issue action](#) | [Screencast](#) | [Import the example](#) | [Related use cases](#)

Use case

Often you do not only use Jira's basic set of features but extend your issues with **custom fields** like our [calculated fields](#).

They work perfectly to **aggregate data** but once in a while you might want to do a **reindex** to **get all up-to-date values** from all issues.

In this use case we will perform an **reindex** on the **current issue** as soon as a **custom field is updated**.

Field changed event

1

Create a **new rule** and name it appropriately.

Providing a description will help you to identify what the rule does but this step is **optional**.

2

Add a **Trigger** **Field changed event**

1

Field

Choose any **custom field** you want to listen to for changes

2

Changed to

Choose **Any value**

Reindex issue action

3

Add **Action** **Reindex issue**

No further configuration needed.

Screencast

This is how the configuration above should look on your screen

No screencast available at the moment

Import the example

Import the **JSON** file below to get started in no time.

JSON

```
{
  "name": "Reindex issue on custom field update",
  "description": "",
  "creator": "admin",
  "status": false,
  "triggerData": "",
  "triggerType": "FIELD_CHANGED_EVENT",
  "configuration": {
    "refs": [
      "issue",
      "system",
      "trigger.issue",
      "trigger.parent"
    ],
    "fieldId": "12202",
    "option": "any",
    "triggerType": ""
  },
  "children": [
    {
      "sequence": 0,
      "type": "REINDEX",
      "ruleEntityType": "ACTION",
      "configuration": {
        "refs": [
          "issue",
          "project",
          "system",
          "trigger",
          "trigger.issue",
          "trigger.parent"
        ]
      },
      "children": null,
      "hasChildren": false
    }
  ],
  "hasChildren": true
}
```
